

XLr8Replicator

Simple & Affordable Replication

For business critical applications such as Order Processing, Payroll, Dispatch, Call Center, and Warehousing this is the most practical solution for ensuring guaranteed system availability, data protection, and disaster recovery. 24/7 data processing shops never have to take down a server to make sure they have a clean backup.

Implementing this solution in the U2 world requires only **three** steps to achieve high levels of availability required by most dynamic organizations today. Those three steps are install and configure the account XLr8 on your U2 database. The second step is to wrap all of your WRITE statements with three lines of code or one line of code for every DELETE statement in your basic programs. The last step is to start the Apache Tomcat.

XLr8Replication uses open source Quartz for job scheduling system that is fully integrated within Apache Tomcat. Full logging capability is built-in using open source Apache log4j which allows a finer granularity that can be controlled by those using this product and use open source Eclipse to view the logs dynamically.

XLr8Replicator is part of U2Weblink™ middleware and uses U2 UniObjects for Java to communicate with either Unidata® or Universe® databases. See our web site for other exciting products and applications.
